7.RP	RATIOS AND PROPORTIONAL RELATIONSHIPS	Student Book	Skiii Builders
7.11	Apply proportional relationships and use them to solve real- world and mathematical problems.		
MGSE7	Compute unit rates associated with ratios of fractions, including		
.RP.1	ratios of lengths, areas and other quantities measured in like or different units. For example, if a person walks 1/2 mile in each		
	1/4 hour, compute the unit rate as the complex fraction $\frac{1/2}{1/4}$		
	miles per hour equivalently 2 miles per hour Recognize and represent proportional relationships between quantities.	DIII: 27-36	26-2, 46-1
a.	Decide whether two quantities are in a proportional relationship,	DIII: 31	26-2, 46-1
	e.g., by testing for equivalent ratios in a table or graphing on a coordinate plane and observing whether the graph is a straight		
b.	line through the origin. Identify the constant of proportionality (unit rate) in tables,		
5.	graphs, equations, diagrams, and verbal descriptions of proportional relationships.		
C.	Represent proportional relationships by equations. For example, if total cost t is proportional to the number n of items purchased at a constant price p, the relationship between the total cost and the number of items can be expressed as $t = pn$.	DIII: 31, 33	
d.	Explain what a point (x, y) on the graph of a proportional relationship means in terms of the situation, with special attention to the points $(0, 0)$ and $(1, r)$ where <i>r</i> is the unit rate.		
MGSE7 .RP.3	Use proportional relationships to solve multi-step ratio and percent problems. Examples: simple interest tax, markups and markdowns, gratuities and commissions, fees, percent increase and decrease, percent error.	DIII: 50-60	28-1, 28-2
7.NS	THE NUMBER SYSTEM		
	Apply and extend previous understandings of operations with fractions to add, subtract, multiply, and divide rational numbers.		
	Apply and extend previous understandings of addition and	DV: 17-21	
	subtraction to add and subtract rational numbers; represent addition and subtraction on a horizontal or vertical number line diagram.		
а.	Show that a number and its opposite have a sum of 0 (are	DV: 11	
	additive inverses). Describe situations in which opposite quantities combine to make 0. For example, your bank account balance is -\$25.00. You deposit \$25.00 into your account, The		

		Student Book	Skill Builders
b.	Understand $p + q$ as the number located a distance $ q $ from p , in the positive or negative direction depending on whether q is positive or pogetive. Show that a number and its opposite have a	DV: 12, 21	48-1
	positive or negative. Show that a number and its opposite have a sum of 0 (are additive inverses). Interpret sums of rational numbers by describing real-world contexts.		
c.	Understand subtraction of rational numbers as adding the additive inverse, $p - q = p + (-q)$. Show that the distance between	DV: 28	58-3
	two rational numbers on the number line is the absolute value of their difference, and apply this principle in real-world contexts.		
d.	Apply properties of operations as strategies to add and subtract rational numbers.	DI: 10-15	2-1, 2-2, 2-3
MGSE7 .NS.2	Apply and extend previous understandings of multiplication and division and of fractions to multiply and divide rational numbers.	DV: 31-38	
а.	Understand that multiplication is extended from fractions to rational numbers by requiring that operations continue to satisfy the properties of operations, particularly the distributive property, leading to products such as $(-1)(-1) = 1$ and the rules for multiplying signed numbers. Interpret products of rational numbers by describing real-world contexts.	DV: 31-34	58-4
b.	Understand that integers can be divided, provided that the divisor is not zero, and every quotient of integers (with non-zero divisor) is a rational number. If <i>p</i> and <i>q</i> are integers, then $-(p/q) = (-p)/q = p/(-q)$. Interpret quotients of rational numbers by describing real-world contexts.	DV : 35-38	58-5
с.	Apply properties of operations as strategies to multiply and divide rational numbers.	DII: 39, 43	2-2, 2-3
d.	Convert a rational number to a decimal using long division; know that the decimal form of a rational number terminates in 0s or eventually repeats.	DII: 74, 75	20-3
MGSE7 .NS.3	Solve real-world and mathematical problems involving the four operations with rational numbers.	DII: 49	43-4, 43-5
7.EE	EXPRESSIONS AND EQUATIONS		
	Use properties of operations to generate equivalent expressions.		
MGSE7 .EE.1	Apply properties of operations as strategies to add, subtract, factor, and expand linear expressions with rational coefficients.	DV: 44, 45, 49	
MGSE7 .EE.2			
	Solve real-life and mathematical problems using numerical and algebraic expressions and equations.		

		Student Book	Skill Builders
MGSE7 .EE.3	Solve multi-step real-life and mathematical problems posed with positive and negative rational numbers in any form (whole numbers, fractions, and decimals) by applying properties of operations as strategies to calculate with numbers, converting between forms as appropriate, and assessing the reasonableness of answers using mental computation and estimation strategies. <i>For example:</i> * <i>If a woman making \$25 an hour gets a 10% raise, she will make an additional 1/10 of her salary an hour, or \$2.50, for a new salary of \$27.50.</i> * <i>If you want to place a towel bar 9 3/4 inches long in the center of a door that is 27 1/2 inches wide, you will need to place the bar about 9 inches from each edge; this estimate can be used as a check on the exact computation.</i>	DV: 65	50-4
MGSE7 .EE.4	Use variables to represent quantities in a real-world or mathematical problem, and construct simple equations and inequalities to solve problems by reasoning about the quantities.	DV: 65	
а.	Solve word problems leading to equations of the form $px + q = r$ and $p(x + q) = r$, where p , q , and r are specific rational numbers. Solve equations of these forms fluently. Compare an algebraic solution to an arithmetic solution, identifying the sequence of the operations used in each approach. For example, the perimeter of a rectangle is 54 cm. Its length is 6 cm. What is its width?		
b.	Solve word problems leading to inequalities of the form $px + q > r$ and $px + q < r$ where p , q and r are specific rational numbers. Graph the solution set of the inequality and interpret it in the context of the problem. For example: as a salesperson, you are paid \$50 per week plus \$3 per sale. This week you want your pay to be at least \$100. Write an inequality for the number of sales you need to make, and describe the solution.		
с.	Solve real-world and mathematical problems by writing and solving equations of the form $x + p = q$ and $px = q$ in which p and q are rational numbers.	DV: 48, 50	50-2, 50-3
7.G	GEOMETRY		
	Draw, construct, and describe geometrical figures and describe the relationships between them.		
MGSE7 .G.1	Solve problems involving scale drawings of geometric figures, including computing actual lengths and areas from a scale drawing and reproducing a scale drawing at a different scale.	DIV: 90	26-1, 46-3
NGSE7 .G.2	Explore various geometric shapes with given conditions. Focus on constructing triangles from three measures of angles and/or sides, noticing when the conditions determine a unique triangle, more than one triangle, or no triangle.	DIV: 13, 15, 16	31-1, 32-2
	Describe the two-dimensional figures (cross sections) that result from slicing three-dimensional figures, as in plane sections of right rectangular prisms, right rectangular pyramids, cones, cylinders, and spheres.		

		Student Book	Skill Builders
	Solve real-life and mathematical problems involving angle		
	measure, area, surface area, and volume.		
MGSE7	Given the formulas for the area and circumference of a circle,	DIV: 69, 70, 83	39-2, 56-1
.G.4	use them to solve problems; give an informal derivation of the		
	relationship between the circumference and area of a circle.		
MGSE7	Use facts about supplementary, complimentary, vertical, and	DIV: 23-25	33-1
.G.5	adjacent angles in a multi-step problem to write and solve simple		
	equations for an unknown angle in a figure.		
MGSE7	Solve real-world and mathematical problems involving area,	DIV: 75, 79	41-2
.G.6	volume and surface area of two- and three-dimensional objects		
	composed of triangles, quadrilaterals, polygons, cubes, and right		
	prisms.		
7.SP	STATISTICS AND PROBABILITY		
7.01	Use random sampling to draw inferences about a		
	population.		
MGSE7	Understand that statistics can be used to gain information about		
.SP.1	a population by examining a sample of the population;		
	generalizations about a population from a sample are valid only if		
	the sample is representative of that population. Understand that		
	random sampling tends to produce representative samples and		
	support valid inferences.		
MGSE7		DIV: 93	47-1
.SP.2	population with an unknown characteristic of interest. Generate		
	multiple samples (or simulated samples) of the same size to		
	gauge the variation in estimates or predictions. For example,		
	estimate the mean word length in a book by randomly sampling		
	words from the book; predict the winner of a school election		
	based on randomly sampled survey data. Gauge how far off the		
	off the estimate or prediction might be.		
	Draw informal comparative inferences about two		
	populations.		
MGSE7	Informally assess the degree of visual overlap of two numerical		
.SP.3	data distributions with similar variabilities, measuring the		
	difference between the medians by expressing it as a multiple of		
	the interquartile range.		
	Use measures of center and measures of variability for numerical	DIV: 92	45-2
.SP.4	data from random samples to draw informal comparative		
	inferences about two populations. For example, decide whether		
	the words in a chapter of a seventh-grade science book are		
	generally longer than the words in a chapter of a fourth-grade		
	science book.		
	Investigate change processes and develop use, and		
	Investigate chance processes and develop, use, and evaluate probability models.		
MGSE7		DIV: 95	47-3
.SP.5	between 0 and 1 that expresses the likelihood of the event		
.01.0	occurring. Larger numbers indicate greater likelihood. A		
	probability near 0 indicates an unlikely event, a probability		
	around 1/2 indicates an event that is neither unlikely nor likely,		
	and a probability near 1 indicates a likely event.		

		Student Book	Skill Builders
.SP.6	Approximate the probability of a chance event by collecting data on the chance process that produces it and observing its long- run relative frequency, and predict the approximate relative frequency given the probability. <i>For example, when rolling a</i> <i>number cube 600 times, predict that a 3 or 6 would be rolled</i> <i>roughly 200 times but probably not exactly 200 times.</i>		
MGSE7 .SP.7	Develop a probability model and use it to find probabilities of events. Compare experimental and theoretical probabilities of events. If the probabilities are not close, explain possible sources of the discrepancy.	DIV: 95, 96	47-3
а.	Develop a uniform probability model by assigning equal probability to all outcomes, and use the models to determine probabilities of events. <i>For example, if a student is selected at</i> <i>random from a class, find the probability that Jane will be</i> <i>selected and the probability that a girl will be selected.</i>	DIV: 95, 96	47-3
b.	Develop a probability model (which may not be uniform) by observing frequencies in data generated from a chance process. For example, find the approximate probability that a spinning penny will land heads up or that a tossed paper cup will land open-end down. Do the outcomes for the spinning penny appear to be equally likely based on the observed frequencies?		
MGSE7 .SP.8	Find probabilities of compound events using organized lists, tables, tree diagrams, and simulations.	DIV: 96	
a.	Understand that, just as with simple events, the probability of a compound event is the fraction of outcomes in the sample space for which the compound event occurs.	DIV: 96	
b.	Represent sample spaces for compound events using methods such as organized lists, tables and tree diagrams. For an event described in everyday language (e.g., "rolling double sixes"), identify the outcomes in the sample space which composed the event.	DIV: 96	
C.	Explain ways to set up a simulation and use the simulation to generate frequencies for compound events. For example, if 40% of donors have type A blood, create a simulation to predict the probability that it will take at least 4 donors to find one with type A blood.		
	DI: Numeration & Whole Numbers		
	DII: Fractions & Decimals		
	DIII: Problem Solving with Percent
